

CONSOLIDATE TURF DEFENCE

Turf Defence is a part of the Consolidate Turf protection range and is a liquid foliar compound mix designed to help raise the plants ability to resist disease.

Consolidate Turf Defence Product Description

Turf managers have always faced ongoing challenges, never more so than in today's fast-paced, results-based environments. Both biotic and abiotic stresses are continually pushing us to seek out remedies and quick fixes.

Individual stress factors can often require a more specific, targeted approach in order to minimise or alleviate the issue. At Consolidate Turf, we pride ourselves in producing lasting solutions that have stood the test of time.

Turf Defence contains micronutrients and amino acids in the form of polyamines. These enable the plant to function in times of high stress such as drought or through toxic stress caused by salinity.

Timing and Mixing

Consolidate Turf products are designed for use all year round providing there is no snow or frost on the ground at the time of application.

Our products are tank mixable with other Consolidate Turf products and due to the unique chemistry, they can be applied as a foliar or root feed.

Ensure all equipment is clean prior to use. When mixing, always start with half water volume and then add the required amount of product for desired area coverage before topping up with remaining quantity of water.

Unique Benefits

- Very quick and effective results.
- Promotes plant health.
- Improved disease and frost tolerance.
- Increased durability through toxic stress.

Application Rates

Use 20 – 40litres of Turf Defence in 300 – 400litres of water per hectare.

Use 200 - 400mls of Turf Defence in 3 - 4litres of water per 100m².
